

Justin K. Oh

New York, NY | (516) 532-8826 | justinoh@nyu.edu | [linkedin.com/in/justin-k-oh](https://www.linkedin.com/in/justin-k-oh) | justinoh9.github.io/portfolio

SUMMARY

Computer Engineering student at NYU Tandon with hands-on experience in software automation, full-stack development, AI evaluation, databases, and embedded systems. Proficient in Python, C/C++, SQL, JavaScript, FastAPI, PostgreSQL, MySQL, and Verilog, with projects spanning AI-assisted workflow automation, e-commerce infrastructure, sentiment analysis, airline reservation systems, and Arduino-based hardware control. Seeking engineering internship opportunities in software, embedded systems, firmware, or computer hardware.

EDUCATION

New York University, Tandon School of Engineering
Bachelor of Science, Computer Engineering

Expected Graduation: May 2027

Relevant Coursework: *Computing in Python, Object Oriented Programming, Data Structures and Algorithms, Computer Architecture, Circuits, Electronics, Digital Logic, Databases, Robot Vision, Discrete Math, Linear Algebra, Differential Equations*

EXPERIENCE

Alltramatic

Software Developer / Operations Automation

New York, NY

Sept 2025 - May 2026

- Built "Jason," an AI-powered WhatsApp assistant for a NYC property management company, automating prospect lead capture, FAQ handling, viewing scheduling, and tenant maintenance routing across two residential buildings.
- Architected a containerized full-stack system — FastAPI/Python backend, PostgreSQL (SQLAlchemy), a Node.js WhatsApp bridge, and a React/Vite admin dashboard — orchestrated with Docker Compose behind an HTTPS reverse proxy.
- Implemented an agentic LLM tool-use loop (Anthropic Claude API) with 9+ tools — listing search, lead capture/qualification, knowledge-base policy retrieval, and human-in-the-loop escalation with dashboard-controlled handoff, persisting all conversations to PostgreSQL.
- Built scheduled outbound automation (rent, late-rent, and lease-renewal reminders; tenant broadcasts) over the Meta WhatsApp Cloud API, plus an analytics dashboard tracking lead funnels, conversion rates, and FAQ frequency.

Coravii

Co-Founder / Developer

New York, NY

May 2025 - Present

- Co-founded and built a direct-to-consumer e-commerce website using Shopify, HTML/CSS, and JavaScript, supporting 3,000+ monthly visitors and \$50,000+ in revenue.
- Managed product pages, analytics tracking, checkout optimization, and live customer-facing site updates across active customer traffic.

Handshake AI Fellowship

AI Model Evaluation Fellow / Contributor

Remote

Feb 2026 - Present

- Evaluated large language model outputs for reasoning quality, factual accuracy, instruction-following, clarity, and safety across structured AI assessment tasks.
- Analyzed prompt-response pairs to identify hallucinations, incomplete reasoning, weak formatting, and failure modes in model-generated answers.
- Provided detailed written feedback and annotations to support model improvement, quality assurance, and human-in-the-loop AI evaluation workflows.

SELECTED PROJECTS

Air Ticket Reservation System

Jan 2026 - May 2026

- Developed a full-stack airline reservation web application using PHP, MySQL, and WAMP with customer authentication, session-based login/logout, flight search, and ticket purchasing features.
- Designed and implemented a normalized relational schema for airlines, airports, airplanes, flights, tickets, customers, and staff, using primary keys, foreign keys, and SQL constraints to preserve data integrity.
- Wrote SQL queries for flight availability, customer booking history, ticket purchases, airline staff reports, and flight management workflows.

Machine Learning Review Analyzer

May 2025 - Sept 2025

- Engineered a Python scraper to ingest 1,000+ Amazon reviews/day, building a labeled dataset for sentiment analysis.
- Implemented a sentiment inference + evaluation pipeline using PyTorch and NumPy (text preprocessing, batching, metric computation), improving classification accuracy by 10% through improved cleaning/labeling and threshold tuning.

Solar Powered Light Tracking Umbrella

Sept 2023 - Jan 2024

- Programmed an Arduino-based light-tracking system in C++ using sensor input and servo motor control to adjust solar panel orientation toward maximum light intensity.
- Measured panel output across fixed-angle and tracking configurations, observing up to 25% higher output under test conditions.
- Collaborated on hardware integration involving Fusion 360, 3D printing, PCB design, sensors, servos, and power circuits under budget constraints.

SKILLS

Programming Languages: C, C++, Python, SQL, Verilog, JavaScript, HTML/CSS, x86 Assembly

Frameworks & Technologies: Git, Linux, MySQL, PostgreSQL, Vivado, FastAPI, React, Node.js
